**Subject:** Issue: Quality of Well Water after expansion of housing developments

(b) (6)

Good Afternoon!

I am reaching out for assistance on behalf of an elderly couple who resides in our congressional district.

The inquiry we received is as follows:

*Our home has well water, and for some unusual geological quirk, and in order to supply the legally-required flow-rate, the well was drilled extremely deep, +/- 200 ft. deep, according to West Vincent Townships' records (which were from before our home received a numbered USPS ZIP-code, so the records are somewhat uncertain). Since our home was built (c. 1980), 4 or 5 or 6 or 7 massive, concentrated housing developments have been built in nearby areas surrounding our land, and I believe they were not sufficiently provided with groundwater reclamation systems. Our well water used to turn muddy/orangey-clay-ish on extremely rare occasions during or after micro-climate droughts. The last many years it has become a practically-constant problem. I am wondering if you are aware of any compensation funds that would help my aged and financially struggling parents and me to ameliorate the situation, or if you could recommend a course of action.*

If we could receive feedback concerning the issue from the EPA's perspective, I would greatly appreciate it. I doubt federal funds would be available to address something like this, but I did want to reach out and see what type of feedback we may be able to receive.

Thank you for your assistance with this request.

Best Regards,

Patrick Beck  
District Representative  
Congressman Ryan Costello (PA-06)
